

Who are TANKBEER® UK?

Tankbeer are the experts in their field and their installations are of the highest standards, which is reflected in the suppliers they work with.

TANKBEER® UK deliver beer in bulk from the brewery directly to the pub, in a way that ensures no CO2 or air interacts with the product, maintaining beer quality and lengthening the life of the product, meaning that what gets served to customers is as fresh as beer poured at the brewery. Tankbeer provides the beer tanks, as well as beer trucks and can handle the logistics of delivery from brewery to pub, making it the simple and cost effective beer transport solution for bars and microbreweries.

“iDraught is the complete package of information”

Sander Huisman, Tankbeer

Tankbeer are expanding quickly, not just in the UK, but across the whole of Europe and iDraught is supporting them on that journey.

Protect Investment

Tankbeer protects the integrity of beer from brewery to tank in the bar. Once the beer is in the tanks in the bar, iDraught takes over the monitoring and ensures that the beer maintains its quality.

iDraught monitors the cellar ambient temperature, making sure the beer is kept at the optimum temperature to reduce the risk of fobbing. There are also intelligent flow meters (IFMs) on beer lines which measure beer temperature at dispense, so quality of product that the consumer receives can be monitored closely.

The IFMs can also differentiate between beer, water and cleaning fluid flowing through the lines, meaning frequency and efficacy of cleaning can be recorded and product quality is maintained.

The iDraught system also records volumes dispensed, giving accurate information on how much beer is left in the tanks and when more needs to be ordered.

“The iDraught data gives good insight and control, especially to the level that the breweries we deal with want. They care about their brand!”

Sustainable Growth

Sander Huisman, one of the masterminds behind Tankbeer, explains how iDraught compliments the Tankbeer system; “we can monitor our system closely, we can see exactly what is going on, but are also able to remotely help our clients and ensure the end consumer gets the highest quality and freshest beer available. iDraught is the complete package of information. For example, monitoring the cellar temperature in combination with the speed of pour can give us the data and direction of a potential issue.”
